

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

I. An Account of the Cause of the late remarkable Appearance of the Planet Venus, seen this Summer, for many Days together, in the Day time. By Edm. Halley, R. S. Secr.

Mathematical Sciences, that they are in many Cases able to prevent the Superstition of the unskilful Vulgar; and by shewing the genuine Causes of rare Appearances, to deliver them from the vain apprehensions they are apt to entertain of what they call *Prodigies*; which sometimes, by the Artifices of designing Men, have been made use of to very evil purposes.

Of this kind was the late Appearance of Venus in the Day time, generally taken notice of about London and elsewhere; and by some reckoned to be Prodigious. This put me upon the enquiry, how it came to pass that at that time the Planer should be so plainly seen by Day, whereas she rarely shews her self so, unless to those who know exactly where to look for her. To resolve this, the following Problem arose, viz. To find the Situation of the Planet in respect of the Earth, when the Area of the illuminated part of her Disk is a Maximum.

To investigate this Maximum, I found it requisite to assume the following Lemmata. I. That the visible Areas of the Disk of the same Planet, at differing Distances, are always reciprocally as the Squares of those Distances; which is evident from the first Principles of Opticks. II. That the Area of the whole Disk of the Planet is to the Area of the illuminated Part thereof, as the Diameter of a Circle to the Versed-Sine of the exteriour Angle at the Planet, in the Triangle at whose Angles are the Sun, Earth, and Planet. III. That in all plain Triangles, sour times the Rectangle of the Sides containing any Angle, is to the excess of the Square of the Sum of the Sides above the Square of the Base, as the Diameter is to the Versed-Sine of the

the Complement of the contained Angle to a Semicircle, which I call the exteriour Angle: This is a new Theorem of good use in Trigonometry, and easily proved from the 12th and 13th of the I!. Elem. Euclid.

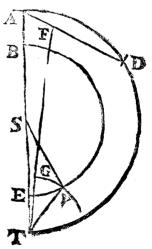

This premised, putting m for the Distance of the Sun and Earth, and n for that of the Sun and Venus, and x for the Distance of the Earth and Venus, or the third Side of the Triangle which we seek; by the third Lemma, 4nx, will be to the excess of the Square of n+x above the Square of m, as the Area of the whole Disk of Venus to the Area of the part illuminated; and by the first Lemma, the Area's of her whole Disk are at all times as the Squares of x reciprocally; whence

the Quantity $\frac{nn+2nx+xx-mm}{4nx^3}$ will in all Cases be

proportional to the Area of the illuminated part.

Now that this should be a Maximum, it is required that the Fluxion thereof be equal to 0, or that the Negative parts thereof be equal to the Affirmative, that is, that $2nx + 2xx \times 4nx^2 = 12nx^2x \times nn + 2nx + xx - mm$; and dividing all by $4nx^2x$, the Equation becomes 2nx + 2xx = 3nn + 6nx + 3xx - 3mm. Consequently 3nn + 4nx + xx = 3mm, and therefore $x = \sqrt{3}mm + nn - 2n$.

From hence a ready and not inelegant Geometrical Construction (if I may be allowed to say so) becomes obvious; for with the Center S and Radius ST = m, describe the Semicircle TDA; and with the same Center and Radius SE = n, the Semicircle EVB; which two Semicircles shall represent the Orbs of the Earth and Venus. Make the chord AD equal to the Radius ST, and from D towards A, lay off DF = SE; draw TF, and thereon place F and F and

TG describe the arch GV, cutting the Semicircle BV E in V; and draw the lines SV, TV: I say the Triangle STV is Similar to that at whose Angles are the Sun, Earth and Venus, at the time when the Area of the enlightned part of that Planet's Disk, as seen from the Earth, is greatest. How this Geometrical Effection follows from the Equation is too evident to need repetition.

In consequence of this Solution, I find this Maximum always to happen, when the Planet is about forty Degrees distant from the Sun; and the times thereof, about the middle between her greatest Elongations on both sides from him, and her retrograde Conjunctions with him; when little more than a quarter of her visible Disk is luminous, and resembling the Moon of about five Days old; and notwithstanding that her Diameter is at that time but 50 Seconds, yet she shines with so strong a Beam, as to surpass the united light of all the fixt Stars that appear with her, and casts a very strong Shade on the Horizontal plain whereon they all shine: an irrefragable Argument to prove that the Disks of the fixt Stars are unconceivably small, and next to nothing; since shining with a native Light, so many of them do not equal the resex Light of one quarter of a Disk of less than a Minute Diameter.

In this situation Venus was found in July last, on the tenth Day, about which time, when the Sun grew low, she was very plainly seen in the Day time, for many Days together: as she might have been in the Mornings, about the latter end of September. But this, arising from the Causes we have now shewn, is nothing uncommon; for every eighth Year it returns again, so that the Planet may be seen on the same Day of the Month and Hour, very nearly in the same place; as all acquainted

with the Heavenly Motions must know.

Lastly, it may not be amiss to note that the Equation $x = \sqrt{3mm + nn} - 2n$ has a Limit; for if n be equal to $\frac{1}{4}m$, the point V will fall on B; and the whole Disk of a Planet at that distance from the Sun would be the Maximum, viz. when in its superior Conjunction with the Sun. And the like if n were less than $\frac{1}{4}m$; the Arch GV in such Case not intersecting the Semicircle BE.
